

Major Threats

Habitat Loss & Degradation, due to

- wildland conversion to animal agriculture
- urbanization and human infrastructure
- pollution, light pollution, pesticides, poisoning
- climate change and extreme weather

Solutions

Habitat improvements and re-wilding, from

- wildland restoration
- wildlife-friendly landscaping, lights-out in migration, glass collision prevention
- diet change – plant-based, meatless Mondays, Veg-anuary
- moving away from fossil fuels & electrifying everything

Save Wildlife: Stop Using Rodenticides!

Rodenticides (rat poisons) are pesticides, and they're a big problem for wildlife like me.

And me!

Rodenticides are everywhere, even when we don't notice them! They're outside most commercial buildings...

Bait dispenser with rodenticide

...and abundant in wildlife. One study found them in 80 percent of Bald Eagles in the US.

80%

I don't like those odds.

Here's the problem:

Rodenticides spread through the food chain, harming and killing wildlife.

And they don't get rid of or stop rodent infestations!

Here's what to do:

Stop using rodenticides.

Remove improperly stored food and waste.

Block any rodents from entering buildings: Seal cracks, put screens on windows, etc.

Welcome, Rats!

Other options to try:

- non-toxic deterrents like essential oils
- catch & release live traps
- an indoor cat
- if you must, other lethal methods besides poison

Advocate for government policies that phase out rodenticides. British Columbia and California have already limited their use!

Your local wildlife thanks you!
